MR. MARK'S MONTHLY MAINTENANCE TIP

Chain Stripper and Carry-back

Fig. 1

Fig. 3

Fig. 2

Generally, there are three types of chain strippers.
Fig.1: A combination tooth cleaner and chain lift-off.
Fig.2: A chain lift-off utilizing the flight to remove the chain from the sprocket.
Fig.3: Roller lift-off for its chain stripper.

The chain stripper's responsibility is to lift the chain from its sprocket as gently and effortlessly as possible. The chain stripper becomes a first impact point as the chain leaves the head sprocket for its return trip to the tail. Because this is a high impact point it should be easily replaceable. As it begins to show wear it will start with a washboarding effect, greatly magnify and advance into the intermediate chain carry-back section if not replaced.

If you or an associate would like to receive these monthly tips, please fill in the blanks and send this fax back to us. Thank you!
